EDUCATION

University of California, Irvine September 2024 - December 2025
M.S. in Computer Science **| GPA: 3.87**
Relevant Coursework: Databases, IoT, Machine Learning, Data Structures, Operating Systems

California State Polytechnic University, Pomona August 2019 - May 2023
B.S. in Computer Science **| GPA: 3.88**
Honors: Summa Cum Laude, Research Distinction

TECHNICAL SKILLS

Programming Languages: Java, Python, JavaScript, SQL, HTML, CSS
Frameworks & Platforms: React, Tailwind CSS, Repast4Py
Cloud & Data: PostgreSQL, MySQL, Supabase, OpenAI API
Developer Tools: Git, GitHub, GitLab, Linux (Ubuntu), Figma, Lucidchart

EXPERIENCE

The Coder School October 2023 – June 2025
Code Coach | Irvine, CA
- Designed and taught Python, Java, and Scratch curricula for 15+ elementary through high school students, adapting one-on-one and small-group lessons to individual skill levels.

Technology Consultant Inc. July 2020 - October 2020
Software Engineering Intern | McLean, VA
- Built a full-stack HR management prototype to centralize employee records and HR workflows, connecting responsive web interfaces to a Supabase-hosted PostgreSQL database.
- Designed PostgreSQL tables and SQL CRUD operations for managing employee records, using database relationships and constraints to maintain consistent data.
- Delivered a functional WordPress website from wireframes and user flows, implementing page layouts and site features with GoDaddy hosting.

PROJECTS

FinePrint Chrome Extension January 2025 - May 2025
- Built a React Chrome extension that uses OpenAI language models to flag potentially risky clauses and summarize concerns before users accept Terms and Conditions.
- Standardized OpenAI API responses through custom prompts and structured output schemas, keeping clause summaries consistent for the extension's risk display.
- Evaluated the extension on 20 Terms and Conditions documents, checking flagged clauses and summaries against publicly available online terms analyses.

Boston Dynamics Spot Research Project March 2023 - May 2023
- Developed Python navigation for Boston Dynamics Spot on a five-person team, integrating the Spot SDK/API into an autonomous package-delivery prototype.
- Programmed Spot to locate itself on a recorded map and reach delivery rooms using GraphNav waypoint navigation and camera-detected April Tag markers.
- Integrated navigation with robotic-arm package handling so Spot could transition from travel to package pickup and delivery at designated locations.

Agent-Based Disease Spread Simulation June 2022 - January 2023
- Developed a Python agent-based simulation of COVID-19 spread, modeling individual behavior and social contacts with Repast4Py for parallel processing.
- Generated a 1,000,000-node Watts-Strogatz network to represent social contacts between simulated individuals.
- Ran 15 validation trials with up to 300,000 simulated individuals, reproducing the rise and decline of COVID-19 infections seen in Orange County CDC data.
- Authored one of 10 papers accepted from 36 submissions to the 2023 Computer Science Conference for CSU Undergraduates.

IdeART Website and Mobile App October 2022 - December 2022
- Developed the full Flutter mobile app, bringing the website's idea generation, post creation, image uploads, and account sign-in features to mobile.
- Built the React website's post-creation workflow with AWS Amplify and GraphQL to store user posts.
- Enforced posting permissions with AWS Amplify, restricting website post creation to authorized users.
